

# Best Kept Secret - Prototype Demo

Mobile-first player, discovery, retention, and community concept.

Record on phone. One confident take.

## BEAT 1 - OPEN SIDE BY SIDE

Current app on left, prototype on right.

"After our call I kept thinking about the product, so I built a quick prototype in your stack - Next.js, Tailwind, and Vercel. Left is the current mobile app, right is the prototype."

## BEAT 2 - HOME AND DISCOVERY

Show light mode, bottom navigation, Continue Listening, compact shelves, mood browsing.

"The first thing is mobile-first polish: a warmer default theme, bottom-tab navigation, compact audio shelves, Continue Listening, and a cleaner mood browser. It feels more like an audio product people can live in."

## BEAT 3 - START PLAYBACK

Tap Ours or the featured listen panel. Mini-player appears.

"Playback starts immediately, and the persistent mini-player is the core product layer. The user can keep browsing without losing the story."

## BEAT 4 - ROUTE-CHANGE MOMENT

Tap Browse. Let the progress visibly move.

"Watch the player as I move to Browse - it keeps advancing, does not skip, and does not reload. The player lives above the routing layer, which is the foundation a real audio product needs."

## BEAT 5 - EXPANDED PLAYER

Show sticky artwork handoff, scrubber, skip, speed, sleep timer, moments.

"The full player adds the retention details: skip controls, speed, sleep timer, saved moments, and a smooth compact artwork handoff while scrolling. That connects directly to bedtime listening and repeat use."

## BEAT 6 - COMMUNITY AND FEEDBACK LOOP

Open Community. Show listen-along, vote, submit idea, recent ideas.

"I also added a community loop: listen-alongs, voting, and story ideas. That turns listeners into collaborators and gives the team clearer signals about what to record next."

# What the prototype now demonstrates

Use this page if they ask what changed beyond the original player demo.

## Retention mechanics

Persistent mini-player, Continue Listening backed by saved progress, afterglow recommendations, moments, favorites, and sleep timer.

## Offline behavior

Offline saving is explicit and separated from runtime playback caching, so playing audio does not accidentally toggle offline mode.

## Mobile polish

Light mode default, equal mobile grids, compact moments, expandable audio shelves, and smoother expanded-player scroll handoff.

## Desktop credibility

Wider desktop shell, desktop navigation, denser grids, and a player layout that no longer feels like a stretched mobile view.

## Discovery upgrades

Search, mood filters, image-like mood mosaic, featured listen panel, and per-section View all behavior for browsing depth.

## Community loop

Listen-along hub, live pulse stats, voting, idea submission, and recent ideas feed to show how BKS can collect demand signals.

[bks-player-prototype.vercel.app](https://bks-player-prototype.vercel.app) - built as a product hypothesis, not a critique.

# Close with senior framing

Keep this calm and technical. The goal is to show taste, product judgment, and implementation awareness.

## CLOSING LINE

"This is a hypothesis, not a critique. I built it in your stack so it maps to production. The next layer would be real event persistence: play, pause, resume, save, vote, and idea submission flowing into analytics and content planning."

## Production gaps to name if asked

- Backend persistence for playback progress, moments, favorites, votes, and ideas.
- Real audio artwork and CMS-driven metadata instead of prototype cover gradients.
- Auth/subscription state tied to tier access, downloads, and billing.
- Analytics funnel: start, 25/50/75%, completion, save, replay, offline, vote.

## On-camera rules

- Navigate only by tapping in-app. Do not reload or type a URL.
- Let the progress number visibly move before saying "keeps advancing."
- Show Browse, Player, Favorites, and Community. Skip anything that feels slow.
- Keep it under 3 minutes. One confident take beats an over-produced one.
- Confirm the Vercel deploy is green and audio plays on the real phone first.
